

Week 1 Internship Tasks

Submitted By : Meenakshi Muthukumaran

Organization : InterNova

Domain : Data Analytics

Task 1

Source Code:

```
create database student_data;
use student_data;
create table Students(
std_name varchar(50),
rollno int,
age int,
marks decimal(3,1),
grade char(1));

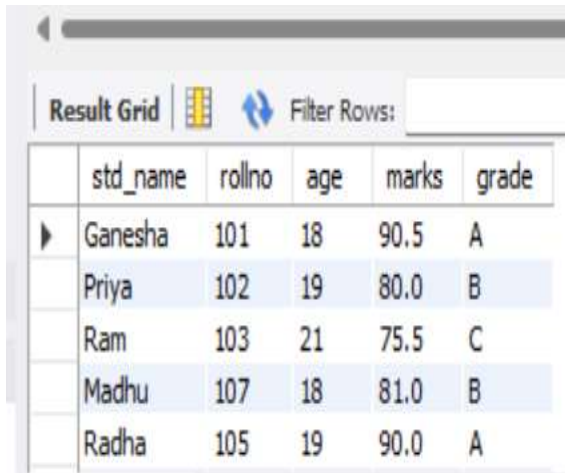

insert into Students(std_name,rollno,age,marks,grade)
values("Ganesha",101,18,90.5,'A'),
("Priya",102,19,80,'B'),
("Ram",103,21,75.5,'C'),
("Madhu",107,18,81,'B'),
("Radha",105,19,90,'A'),
("Meera",108,18,92,'A');
select * from Students;
select std_name,rollno,marks from Students;
```

Task 1

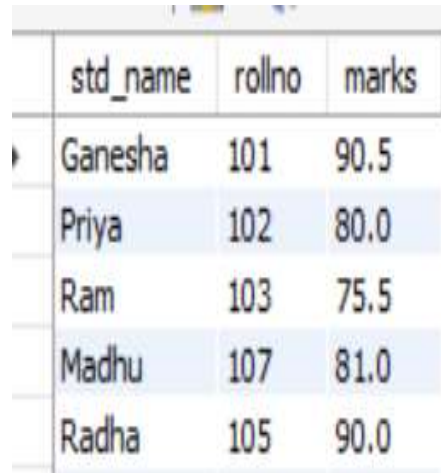

Source Code:

```
select std_name as student_name,marks as Scorefrom Students;
```

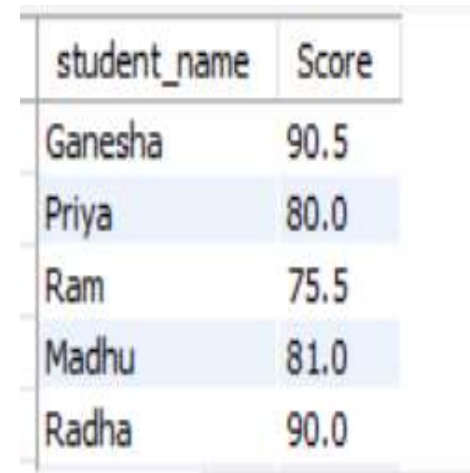

Output:

	std_name	rollno	age	marks	grade
▶	Ganesha	101	18	90.5	A
	Priya	102	19	80.0	B
	Ram	103	21	75.5	C
	Madhu	107	18	81.0	B
	Radha	105	19	90.0	A

	std_name	rollno	marks
▶	Ganesha	101	90.5
	Priya	102	80.0
	Ram	103	75.5
	Madhu	107	81.0
	Radha	105	90.0

	student_name	Score
	Ganesha	90.5
	Priya	80.0
	Ram	75.5
	Madhu	81.0
	Radha	90.0

Task 1

Brief Explanation:

- 1) Created and used a sample database table.
- 2) Retrieved complete table data using `SELECT *`.
- 3) Selected required columns using `SELECT`.
- 4) Used column aliases with `AS` for clear and meaningful column names.
- 5) Practiced basic SQL data retrieval.

Task 2

Source Code:

```
use student_data;
select * from students;
#Filter records using the WHERE clause.
select std_name,age from students where age=18;
select std_name,grade from students where grade between 'A' and 'C';
# Use comparison operators in conditions.
select std_name,marks from students where marks<=80;
# Sort records using ORDER BY.
select * from students order by marks desc;
select std_name,age from students order by age;
#Perform calculations using aggregate functions:
select count(*) as total_strength from students;
select sum(marks) as total_marks from students;
select round(avg(marks),2) as avg_marks from students;
select min(age) as minimum_age from students;
select max(age) as maximum_age from students;
```

Task 2

Source Code:

```
select std_name as student_name,marks as Scorefrom Students;
```

Output:

The image displays four separate SQL query result grids, each with a 'Result Grid' header and a 'Filter Rows' button. The grids show the following data:

total_strength
6

total_marks
509.0

avg_marks
84.83

minimum_age
18

maximum_age
21

Brief Explanation:

- Filtered and sorted records.
- Used comparison operators.
- Applied COUNT(), SUM(), AVG(), MIN(), and MAX().
- Displayed query results

Task 3

Source Code:

```
select * from students;
#Group records using GROUP BY.
#Counting number of students are in each grade:

select grade,count(std_name) as count from studentsgroup by grade;

# Aggregate value for each group#
Find the average marks for each gradeselect grade,
round(avg(marks),2) as average_marks
from studentsgroup by grade;

#Use the HAVING clause to filter grouped results.
# display only grades where the average marks are above 85

select grade,avg(marks) as avg_marks from students
group by grade having avg_marks>85;
```

Task 3

Output:

	grade	average_marks
▶	A	90.83
	B	80.50
	C	75.50

	grade	avg_marks
▶	A	90.83333

	grade	count
▶	A	3
	B	2
	C	1

Brief Explanation:

- Grouped records using GROUP BY.
- Calculated aggregate values for each group.
- Filtered grouped results using HAVING.
- Displayed the results.

Task 4

Source Code:

```
select * from students;  
use student_data;
```

#Courses table

```
create table courses(  
rollno int,  
course varchar(50),  
department varchar(50));  
insert into courses(rollno,course,department)  
values(101,"AI","CSE"),  
(102,"DS","ECE"),  
(103,"Python","EEE"),  
(104,"Java","Mech"),  
(105,"ML","CSE"),  
(106,"AIML","ECE");  
select * from courses;
```

Task 4

Source Code:

#Inner Join

```
select s.std_name ,s.rollno,c.course,c.department from students  
as s inner join courses as c  
on s.rollno=c.rollno;
```

#left join

```
select s.std_name,s.rollno,c.course from students as s  
left join courses as c  
on s.rollno=c.rollno;
```

#Right join

```
select s.std_name,c.course from students as s  
right join courses as c  
on s.rollno=c.rollno;
```

Task 4

Output:

	std_name	rollno	course	department
▶	Ganesha	101	AI	CSE
	Priya	102	DS	ECE
	Ram	103	Python	EEE
	Radha	105	ML	CSE

	std_name	rollno	course
▶	Ganesha	101	AI
	Priya	102	DS
	Ram	103	Python
	Madhu	107	NULL
	Radha	105	ML

	std_name	course
▶	Ganesha	AI
	Priya	DS
	Ram	Python
	NULL	Java
	Radha	ML

Brief Explanation:

- Used two related tables with a common column.
- Applied INNER JOIN, LEFT JOIN, and RIGHT JOIN.
- Compared the results of each join.

Task 5

Source Code:

#Subqueries

#Find students scoring above the average marks

```
select * from students;  
select std_name,marks from students  
where marks >(select avg(marks) as avg_marks from students);
```

#Find students who have the highest marks

```
select std_name,marks from students  
where marks = (select max(marks) from students);
```

Task 5

Output:

Result Grid		 Filter
	std_name	marks
▶	Ganesha	90.5
	Radha	90.0
	Meera	92.0

Result Grid		 Filter Row
	std_name	marks
▶	Meera	92.0

Brief Explanation:

- 1)Used subqueries to solve two query problems
- 2)Retrieved result based on another query's result

Task 6

Task 6

Brief Explanation:

- 1) Imported the dataset into Excel.
- 2) Formatted headers and data appropriately.
- 3) Adjusted column widths for readability.
- 4) Applied suitable number/date formats.
- 5) Sorted records in ascending/descending order.
- 6) Applied filters to selected columns.
- 7) Filtered records based on specific conditions.
- 8) Captured screenshots of the final results.

Task 7

High	
High	
High	
High	

Note:

Determined performance column using SUMIF

Task 7

Brief Explanation:

- Applied **Conditional Formatting** to highlight values based on conditions.
- Used IF() to perform logical checks.
- **Syntax:** =IF(condition, value_if_true, value_if_false)
- Used COUNTIF() to count cells matching a condition.
- **Syntax:** =COUNTIF(range, criteria)
- Used SUMIF() to calculate values based on a condition.
- **Syntax:** =SUMIF(range, criteria, sum_range)
- Verified the results and explained the purpose of each function.

Task 8

OUTPUT:

Order_ID	Order_Date	Customer_ID	Customer_Name	Product_ID	Product	Category	Region	Quantity	Unit_Price	Sales	Performance	Payment_Method	Order_Status

ORD1041	06-05-2026	C101	Arun	P001	Laptop	Electronics	South	1	55000	55000	High	UPI	Delivered

Task 8

OUTPUT:

VLOOKUP:

1) Find the customer name with order id ORD1070

Meena

2) Find the product purchased by the customer with order id ORD1068

Monitor

XLOOKUP:

1) Find the total sales of printer?

62500

2) Customer named meena is from which region?

East

VLOOKUP	XLOOKUP
Searches from left to right	Can search in any direction
Uses a column number	Directly specifies the return column
Requires the lookup column to be first	Lookup and return columns can be separate
Available in older Excel versions	Available in newer Excel versions

Task 8

Brief Explanation:

- Created/used two related Excel tables.
- Identified a common column between the tables.
- Used VLOOKUP() to retrieve related information.
- **Syntax:** =VLOOKUP(lookup_value, table, col_index_num, FALSE)
- Used XLOOKUP() to retrieve related information.
- **Syntax:** =XLOOKUP(lookup_value, lookup_array, return_array)
- Compared the usage of VLOOKUP() and XLOOKUP().
- Captured screenshots of the results.
